

CS608 - WEB DEVELOPMENT LAB

M TECH

Exercise 7

Develop a Web-Based **Grocery Management System** using **AJAX, PHP and SQLite**

Requirements:

1. Create a main page (index.php) with 3 options (simple links or buttons):
 - a. Add Grocery Items
 - b. View Grocery Catalog
 - c. Logout (just a link that redirects to index.php and clears any session if used)
2. Create “Add Grocery Items” section (single page or simple form):
 - a. Form fields to add one grocery item at a time:
 - i. Item ID (e.g., GR001)
 1. Item Name
 2. Category
 3. Quantity
 4. Price
 5. Status (Available / Issued)
 - b. Use AJAX to send the grocery item data to the server without refreshing the page.
 - c. The server should store the grocery item in the database.
3. Create “View Grocery Catalog” page that:
 - a. Uses AJAX to request grocery item data from the server.
 - b. The server retrieves the data from the database.
 - c. The retrieved data is displayed dynamically in the browser as a table.
 - d. The page should update automatically without refreshing.
 - e. If no items exist, display the message: "No grocery items available. Please add items first."
4. Provide functionality to delete grocery items.
 - a. Each row in the catalog table should contain a Delete button.
 - b. When clicked, an AJAX request is sent to the server.
 - c. The server deletes the selected item from the database.
 - d. The catalog table updates automatically.
5. Provide functionality to search grocery items.
 - a. Add a search textbox on the catalog page.
 - b. As the user types, an AJAX request fetches matching grocery items.
 - c. Results should update dynamically without page refresh.
6. On the View Catalog page, also display:
 - a. Total number of grocery items available.
 - b. A refresh button to reload the catalog using AJAX.
