

CS608 - WEB DEVELOPMENT LAB

M TECH

Exercise 11

1. Implement AES encryption and decryption in PHP for secure message transmission.
2. Develop a PHP program to hash passwords and verify user login securely.
3. Create a PHP application to generate and validate digital signatures using public/private keys.
4. Build a secure file upload system in PHP with encrypted storage.
5. Implement RSA encryption in PHP for client-server communication.
6. Develop a PHP script to securely store and retrieve sensitive user data using encryption.
7. Create a PHP program to demonstrate secure session management with encrypted session data.
8. Implement a PHP application to prevent man-in-the-middle attacks using cryptographic techniques.
9. Develop a PHP-based system to encrypt and decrypt database records.
10. Create a PHP program to generate secure tokens for authentication using cryptographic functions.
