

Smart Digital Wellbeing & Productivity Analytics Platform

An AI-driven ecosystem for browser tracking & classification, designed to enhance productivity without system-level access.

Mission

Browser-based platform monitoring web usage, classifying behavior with AI, and providing real-time insights.

Core Objectives

Track active browsing, classify sites (productive/non-productive) using AI, and deliver real-time analytics while maintaining privacy.

System Architecture Overview

Our platform utilizes a modular three-tier web application architecture, separating user interaction, application logic, and data storage for optimal performance and scalability.

Presentation Layer

HTML5/CSS3/JavaScript for browser-based execution, focus/blur detection, and dashboard visualization.

Application Layer

Node.js core backend and Django AI service handle authentication, business logic, and AI orchestration via REST APIs.

Data Layer

MySQL database stores usage logs, analytics, and aggregated productivity metrics.

Service-Oriented AI Integration

The AI classification module operates as an independent service, ensuring decoupled core logic and enhanced flexibility.

This architecture allows for independent AI model updates, scalability, and clear separation of concerns.

Event-Driven & Reactive System Design

Our platform employs event-driven logic to dynamically respond to user activity, ensuring a seamless and responsive experience.

Event Detection

JavaScript listeners monitor focus, blur, and visibility changes for active user state tracking.

Asynchronous Processing

AJAX updates state without page reloads, facilitating non-blocking communication with the backend.

Real-Time Feedback

WebSockets enable instant notifications and alerts when productivity limits are exceeded.

Security, Privacy & Data Flow

We prioritize secure and privacy-preserving operations through robust architecture and metadata-only tracking.

Security Architecture

- Secure authentication
- Hashed password storage
- Session-based access control
- Backend validation of requests

Privacy Scope

- Only metadata tracked: domain name, page title, time spent.
- No browsing content or personal data recorded.

Browser Activity

Node.js Processing

AI Classification

Database Storage
